Patent No. 602721
GENERAL INFORMATION:
APPLICANT: CHANG, Li-Yen Edward
APPLICANT: CHANG, Ching-Long
APPLICANT: HWONG, Ching-Long
APPLICANT: LO, Cheng-Kai
TITLE OF INVENTION: No. 602721el Catalase, The Gene Thereof and
TITLE OF INVENTION: Catalase Using Genetic Engineering Technology
NUMBER OF SEQUENCES:
ADDRESSEE: McDonnell Boehnen Hulbert & Berghoff
STREET: 300 S. Wacker Drive Suite 3200 ö Length 3466; GGTGGGGATGCGTCGAATGGGCTGGACCAGCCCGGTGTGTATAT 3021 2593 GACGGGGACGGGGTGTATTCGGAGGAGTCGGTGGACATGTTTGT 2636 Indels ZIP: 66066
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: U\$/09/027,166
ELLING DATE: 20-FEB-1998
CLASSIFICATION NATA:
APPLICATION NUMBER: TW 8610018
FILING DATE: 03-JAN-1997
PRIOR APPLICATION NUMBER: W97120386.5
FILING DATE: 11-DEC-1997
ATOREST NUMBER: 37,293
REFIRENCE/DOCKET NUMBER: 37,293
REFIRENCE/DOCKET NUMBER: 37,293
REFIRENCE/DOCKET NUMBER: 37,293
REFIRENCE/DOCKET NUMBER: 98,180
TELECOMMUNICATION INFORMATION:
TELEPHONE: (312) 913-0001
TELECOMMUNICATION INFORMATION:
TELEPHONE: (312) 913-0002
TELECOMMUNICATION INFORMATION:
TELEPHONE: (312) 913-0002
TELECOMMUNICATION INFORMATION:
TELEPHONE: (312) 913-0002
TELEPHONE: (312) 913-0002 4.0%; Score 156.2; DB 3; 60.5%; Pred. No. 2.9e-31; 11ve 0; Mismatches 168; 1460 g

Patent No. 6410718

GENERAL INFORMATION:
APPLICANT: Bloksberg, Leonard N.
APPLICANT: Bloksberg, Leonard N.
TITLE OF INVENTION: Materials and Methods for the
TITLE OF INVENTION: Materials and Methods for the
TITLE OF INVENTION: Modification of Plant Lignin Content
CURRENT APPLICATION UNMBER: US/09/615,192A

CURRENT FILING DATE: 2000-07-12
PRIOR APPLICATION NUMBER: US 08/975,316
PRIOR APPLICATION NUMBER: US 08/975,316
PRIOR APPLICATION NUMBER: US 08/975,316
PRIOR FILING DATE: 1996-09-11
PRIOR APPLICATION NUMBER: US 09/169,789

PRIOR FILING DATE: 1998-10-09

NUMBER OF SEQ ID NOS: 405

SOFTWARE: FastSEQ for Windows Version 3.0

               The present sequence represents the M antigen gene isolated from Histoplasma capsulatum (HC). HC polypeptides can be used for detecting antibodies for detecting a previous or current HC infection in a subject. They can also be injected into the skin of a subject to detect past exposure to HC by detecting swelling of the skin. The antibodies can be used for detecting current HC infection in a subject. HC nucleic histoplasmosis as well as in vaccines for the prevention of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The Aspergillus niger catR gene was identified and isolated. The native promoter of the gene was removed and replaced with the Aspergillus glucoamylase promoter gene. This modification allows increased expression of the catR gene without the need to supply hydrogen peroxide to induce expression. Cells into which this construct is inserted preferably have the glucose oxidase gene (goxA) deleted. This deletion minimises the generation of glucomate waste material and the use of waste treatment processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Aspergillus niger catR gene sequence – from which catR promoter has been deleted and Aspergillus glucoamylase promoter gene has been inserted

This modification allows increased expression of the catk gene without the need to supply hydrogen peroxide to induce expression. Cells into which this construct is inserted preferably have the glucose oxidase gene (goxA) deleted. This deletion minimises the generation of gluconate waste material and the use of waste treatment processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Aspergillus niger catR gene sequence - from which catR promoter has been deleted and Aspergillus glucoamylase promoter gene has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 424.8; DB 14; Length 3108; Pred.                                                                                                This sequence represents the catR gene of A. niger and encodes the catalase-R protein. This enzyme catalyses the conversion of hydrogen peroxide tro oxygen and water. Catalase-R is a soluble extended shelf life and is stable over a wide pH range, has concentrations of hydrogen peroxide. Catalase-R is more effective than beef liver catalase for neutralisation of concentrated (eg. 3%) hydrogen peroxide solutions. This catalase may be used in the cleaning and disinfecting of contact lenses.

the direct filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be discovered, possible functions of unknown open reading frames can be capture copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells anotitored. The expression of genes can be used to study how FF cells anotitored. The expression metabolic or catabolic pathway confined in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway confined in culture and organisation of the morphogenesis, recombination of redundancy as one spot on an increarrays based on function of the gene products to facilitate analysis of the results. AAF07478 to AAF11247 represents ESTs from Aspergillus practime, analysis of the results. AAF07478 to AAF11857 from Aspergillus or pages to AAF14873 represents ESTs from Aspergillus presents and specifically claimed in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 1186 BP; 252 A; 350 C; 289 G; 294 T; 1 other;

                                                                                                                                                                                                                                                                                                          Genomic DNA (T42791) from Scytalidium thermocellum codes for catabase (W06109), an enzyme useful for scavening H202, e.g. in pasteurisation and bleaching. To obtain the gene, PCR primers (see also T42792-93) based on partial peptide sequences of the catabase were used to amplify S. thermophilum genomic DNA. An isolated ENBL4, and a clone conte. the catabase coding region was isolated. The gene can be incorporated into an expression vector and used for the prodn. of catabase in transformed host (esp. Aspergillus) host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               produce

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the Fr cells and a substrate of expressed sequence tags (EST). The ESTS care used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production of potential of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be contituded and gene copy number variation and stability can be identified and gene copy number variation and stability can be considered. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore considered. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore confineering. Using ESTS provides several advantages over genomic or random conA closes including elimination of redundancy as one spot on array equals one gene or open reading frame, and organisation of the canalysis of the results. AAF01478 to AAF11247 represents ESTS from Aspergillus orgase; and niger; AAF11854 to AAF14878 represents ESTS from Aspergillus orgase; and AAF14879 to AAF18537 represents ESTS from Aspergillus orgase; and a specifically claimed in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2608

The invention describes a method of monitoring differential expression of genes in a first Bacillus cell relative to expression of the genes in cother Bacillus cells. Comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus clocated from Bacillus cells to a substrate containing array of Bacillus cells as spot in the array. The method is useful for measuring the expression of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cells in the method is useful for monitoring of a spot in one or more second Bacillus cells. The method is useful for monitoring genes, identifying possible functions of unknown open reading frames and controring gene copy number variation and stability. Monitoring changes in expression of genes may be used to provide a representation of the way control of genes may be used to provide a representation of the way control of genes may be used to provide a representation of the way control of genes may be used to provide a representation of the way control of genes may be used to provide a representation of the way control of genes and per physiological provocation. Extensive follow-up characterisation is unnecessary, when one spot on an array cequals one gene or one open reading frame, since sequence information is the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes: (1) a new catalase obtained by cloning the Bacillus thermoglucosidasius; and (11) a process for preparing the catalase with high output, based on a genetic endineering technique that comprises: the catalase gene cloned from the microbe is used to form its expression plasmid and cells are transformed to obtain the expression product. Also described are a plasmid and transformed cells produced by the process, as well as a composition containing the new catalase used to decompose residual hydrogen peroxide in contact lens disinfecting liquids. The present sequence represents a catalase kat HPII gene sequence, which is given in an example from the present invention.
 catalase: The gene, a composite containing it and its preparation 1 - useful for removal of hydrogen peroxide from contact lens

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential comparation is also used in the encoded proteins. The prokaryotes used are been their coll, Staphylococcus aureus, Salmonella typhi, Klebsiella typhines and salmonella typhi, Klebsiella proudmonas aeruginosa and Enterococcus faecalis. The pround of an antibiotic development. The antisense nucleic acids can also be used for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids sequence is also useful to screen a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1217

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a catalase isolated from Bacillus thermoglucosidasius. A composition containing a B, thermoglucosidasius datalase is used to decompose hydrogen peroxide present in residual disinfectant remaining on a contact lens to avoid undestired injury to users. The catalase enzyme can also be used to treat textile substances from a non-nammalian source and reducing the need to use bovine liver catalases so the risk of cross infection from cows to humans is reduced. The production procedure is simple and has low cost thith high yield of enzyme. The present sequence represents the catalase kat HPII gene from an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated catalase gene derived from Bacillus thermoglucosdasius useful for decomposing hydrogen peroxide in residual disinfectant remaining on a contact lens -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerses chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The for identifying expressed and in adaptostics as expressed sequence tags to identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical
Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess blodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID No 28517; 103pp; English.

disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Once: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
